Daikin unveils world's first CO_2-based VRV® system

Daikin Europe N.V. announces the world's first CO_2-based VRV® system. CO_2 has one of the lowest GWP[1] values (GWP=1) of all existing refrigerants, once again demonstrating Daikin's pioneering care for the environment.

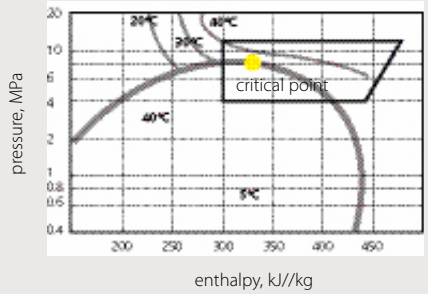
The launch is one more in a series of world firsts for Daikin. As was the case with the launch of the 1st VRV® generation in the early 1980s, the launch of a CO_2-based VRV® system will lead to new installation techniques and certifications. Here again Daikin is fulfilling its pioneering role in this process, paving the way for new technologies and products. The new CO_2-based VRV® is part of Daikin's strategy to limit the impact of air conditioning on the environment and to stay ahead of environmental legislation.

Daikin is worldwide market leader in VRF systems, and intends to keep pursuing various technical challenges, such as the development of the CO_2-based VRV® system, to play a responsible role as a leader. At the same time, Daikin intends to perfect its existing HFC[2]-based VRV® systems, further reducing the TEWI[3] impact of both ranges.

[1]GWP = Global Warming Potential
[2]HFC = HydroFluoroCarbon (e.g.: R410A, R407C)
[3]TEWI: "Total Equivalent Warming Impact": sum of direct (refrigerant) and indirect (energy use) emissions of air conditioning technologies expressed in CO_2 equivalents. TEWI confirms the importance of energy efficiency and emissions reduction for air conditioning systems.

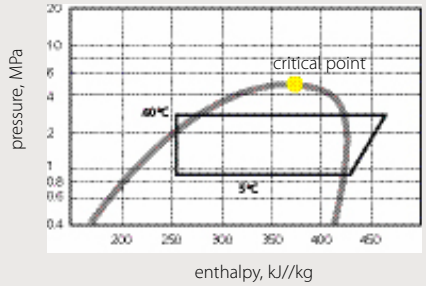
Transcritical refrigerant cycle:

For example: CO_2



Subcritical refrigerant cycle:

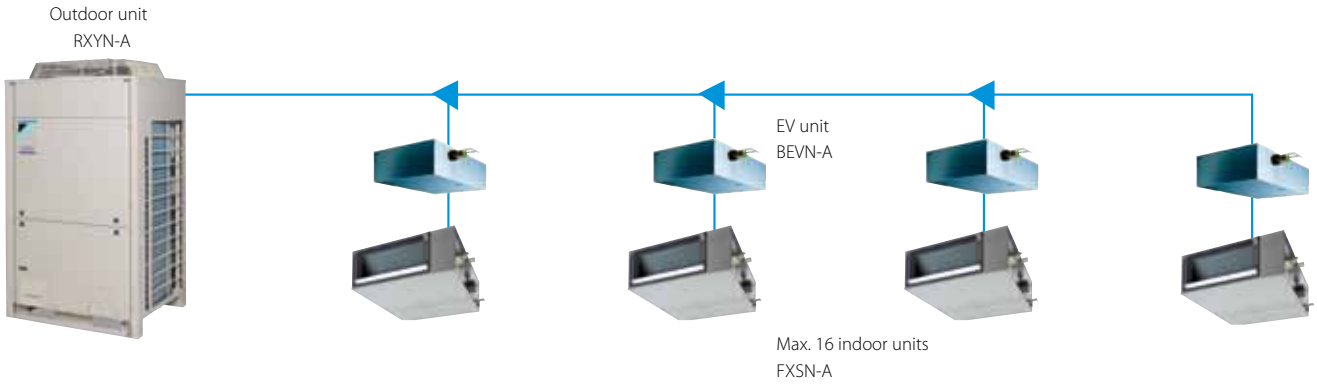
For example: R-410A



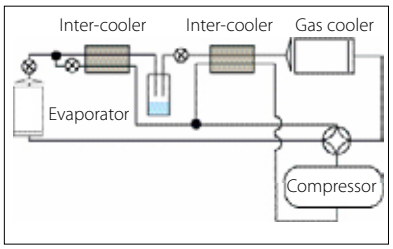
Transcritical refrigerant cycle

CO_2 has a very low critical temperature, so for most applications it is used in a transcritical cycle. A transcritical cycle is a cycle where a part of the process takes place at pressures above the critical point and other parts below the critical point. The critical point marks the upper limit for heat transfer processes based on evaporation or condensation. At temperatures and pressures higher than those at the critical point, there is no clear distinction anymore between liquid and vapour and it is technically challenging to control the refrigerant. Daikin is the first in the industry to use CO_2 in a VRV® system. All refrigerants have a critical point, however for conventional refrigerants this point is never reached during the entire cycle, this is called a subcritical refrigerant cycle.

System Layout



Introducing new technologies



- **Dual Stage Intercooler (D.S.I.) circuit**: The D.S.I. circuit enables refrigerant control within the CO_2-based VRV® system and allows downsizing of the piping size.
- **New compressor optimised for CO_2:** The CO_2-based VRV® system is equipped with two new dual swing compressors. These compressors were developed and produced by Daikin to cope with the higher pressure differentials required for the transcritical cycle of CO_2 and to reduce the leak losses.
- **New heat exchanger:** A new three row heat exchanger and pass pattern has been developed for optimum heat exchange in the transcritical point.
- **Expansion valve:** A new electronic expansion valve and a new four way valve have been developed to cope with the higher pressures of CO_2 (up to 12.3MPa).

Features

- **Global Warming Potential = 1:** The Daikin CO_2-based VRV® system is the first VRF system in the market using CO_2 (R-744) as refrigerant. The GWP of CO_2 is 1, making it potentially one of the most environmental conscious refrigerants used.
- **Ozone Depletion Potential = 0:** Like R-410A, CO_2 has no negative impact on the ozone layer when released into the atmosphere.
- **Smaller piping diameters:** Because of the higher pressures of a CO_2 system the piping diameters are smaller. Also the amount of refrigerant in the system is lower.
- **Automatic Test:** When refrigerant charging has ceased, pushing the test operation button on the PCB will initiate a check on the wiring, shut off valves, sensors and refrigerant volume. This test ceases automatically when completed.
- **Night quiet mode:** For some applications the operating sound level of the outdoor unit might be too high. Therefore the sound level can be fixed, via the super silent mode, in order to avoid noise pollution.
- **Connectable to all Daikin Control systems**

Heating & Cooling

RXYN-A				10 HP
Nominal capacity		cooling	kW	28.0
		heating	kW	31.5
COP		cooling		2
		heating		3
Dimensions	height		mm	1,680
	width		mm	930
	depth		mm	765
Weight			kg	330
Air Flow Rate (nominal at 230V)		cooling	m³/min	185
Refrigerant	type			R-744
	charge		kg	7.2
Piping Connections	liquid	diameter (OD)	mm	9.52 (Brazed)
	gas	diameter (OD)	mm	15.9 (Brazed)

Notes: Nominal cooling capacities are based on : indoor temperature : 27°CDB, 19°CWB, outdoor temperature : 35°CDB, equivalent refrigerant piping : 7.5m, level difference : 0m.
Nominal heating capacities are based on : indoor temperature : 20°CDB, outdoor temperature : 7°CDB, 6°CWB, equivalent refrigerant piping : 7.5m, level difference : 0m

FXSN-A				20	25	32	40	50	63	100

RXYN10A

In all of us, a green heart

Daikin's unique position as a manufacturer of air conditioning equipment, compressors and refrigerants has led to its close involvement in environmental issues. For several years Daikin has had the intention to become a leader in the provision of products that have limited impact on the environment. This challenge demands the eco design and development of a wide range of products and an energy management system, resulting in energy conservation and a reduction of waste.

VRV® products are not within the scope of the Eurovent certification programme.
